Attorney's Docket No. NC28066

**IN THE UNITED STATES PATENT AND TRADEMARK OFFICE**

Box Patent Application  
Assistant Commissioner for Patents  
Washington, D.C. 20231

**NEW APPLICATION TRANSMITTAL**

Transmitted herewith for filing is the patent application of

Inventor(s): Janne Aaltonen  
Ari Ikonen  
Pekka Talmola

*WARNING: Patent must be applied for in the name(s) of all of the actual inventor(s). 37 CFR 1.41(a) and 1.53(b).*

For (title): Mobile Multimedia Terminal for DVB-T and Large and  
Small Cell Communication

---

**CERTIFICATION UNDER 37 CFR 1.10**

I hereby certify that this New Application Transmittal and the documents referred to as enclosed therein are being deposited with the United States Postal Service on this date, August 27, 1999, in an envelope as "Express Mail Post Office to Addressee" Mailing Label Number EJ735733080US, addressed to the: Assistant Commissioner for Patents, Washington, D.C. 20231.

Beverly French  
(type or print name of person mailing paper)

  
Signature of person mailing paper

NOTE: Each paper or fee referred to as enclosed herein has the number of the "Express Mail" mailing label placed thereon prior to mailing. 37 CFR 1.10(b).

WARNING: Certificate of mailing (first class) or facsimile transmission procedures of 37 CFR 1.8 cannot be used to obtain a date of mailing or transmission for this correspondence.

## 1. Type of Application

This new application is for a(n)  
(check one applicable item below)

☒ Original (nonprovisional)

☐ Design  
☐ Plant

**WARNING:** Do not use this transmittal for a completion in the U.S. of an International Application under 35 U.S.C. 371(c)(4), unless the International Application is being filed as a divisional, continuation or continuation-in-part application

**WARNING:** Do not use this transmittal for the filing of a provisional application.

**NOTE:** If one of the following 3 items apply, then complete and attach **ADDED PAGES FOR NEW APPLICATION TRANSMITTAL WHERE BENEFIT OF A PRIOR U.S. APPLICATION CLAIMED** and a **NOTIFICATION IN PARENT APPLICATION OF THE FILING OF THIS CONTINUATION APPLICATION**.

- ☐ Divisional.  
☐ Continuation.  
☐ Continuation-in-part (C-I-P).

## 2. Benefit of Prior U.S. Application(s) (35 U.S.C. 119(e), 120, or 121)

**NOTE:** If the new application being transmitted is a divisional, continuation or a continuation-in-part of a parent case, or where the parent case is an International Application which designated the U.S., or benefit of a prior provisional application is claimed, then check the following item and complete and attach **ADDED PAGES FOR NEW APPLICATION TRANSMITTAL WHERE BENEFIT OF PRIOR U.S. APPLICATION(S) CLAIMED**.

**WARNING:** If an application claims the benefit of the filing date of an earlier filed application under 35 U.S.C. 120, 121 or 365(c), the 20-year term of that application will be based upon the filing date of the earliest U.S. application that the application makes reference to under 35 U.S.C. 120, 121 or 365(c). [35 U.S.C. 154(a)(2) does not take into account, for the determination of the patent term, any application on which priority is claimed under 35 U.S.C. 119, 365(a) or 365(b).] For a c-i-p application, applicant should review whether any claim in the patent that will issue is supported by an earlier application and, if not, the applicant should consider canceling the reference to the earlier filed application. The term of a patent is not based on a claim-by-claim approach. See Notice of April 14, 1995, 60 Fed. Reg. 20,195, at 20,205.

**WARNING:** When the last day of pendency of a provisional application falls on a Saturday, Sunday, or Federal holiday within the District of Columbia, any nonprovisional application claiming benefit of the provisional application must be filed prior to the Saturday, Sunday, or Federal holiday within the District of Columbia. See 37 C.F.R. § 1.78(a)(3).

- ☐ The new application being transmitted claims the benefit of prior U.S. application(s). Enclosed are **ADDED PAGES FOR NEW APPLICATION TRANSMITTAL WHERE BENEFIT OF PRIOR U.S. APPLICATION(S) CLAIMED**.

## 3. Papers Enclosed That Are Required for Filing Date under 37 C.F.R. 1.53(b) (Regular) or 37 C.F.R. 1.153 (Design) Application

16 Pages of specification

9 Pages of claims

1 Page of Abstract

4 Sheets of drawing

- ☐ formal  
☒ informal

**WARNING:** *DO NOT* submit original drawings. A high quality copy of the drawings should be supplied when filing a patent application. The drawings that are submitted to the Office must be on strong, white, smooth, and non-shiny paper and meet the standards according to § 1.84. If corrections to the drawings are necessary, they should be made to the original drawing and a high-quality copy of the corrected original drawing then submitted to the Office. Only one copy is required or desired. Comments on proposed new 37 CFR 1.84. Notice of March 9, 1988 (1990 O.G. 57-62).

**NOTE** "Identifying indicia, if provided, should include the application number or the title of the invention, inventor's name, docket number (if any), and the name and telephone number of a person to call if the Office is unable to match the drawings to the proper application. This information should be placed on the back of each sheet of drawing a minimum distance of 1.5 cm (5/8 inch) down from the top of the page." 37 C.F.R. 1.84(c).

(complete the following, if applicable)

- ☐ The enclosed drawing(s) are photograph(s), and there is also attached a "PETITION TO ACCEPT PHOTOGRAPH(S) AS DRAWING(S)." 37 C.F.R. 1.84(b).

**4. Additional papers enclosed**

- ☐ Preliminary Amendment
- ☐ Information Disclosure Statement (37 C.F.R. 1.98)
- ☐ Form PTO-1449
- ☐ Citations
- ☐ Declaration of Biological Deposit
- ☐ Submission of "Sequence Listing," computer readable copy and/or amendment pertaining thereto for biotechnology invention containing nucleotide and/or amino acid sequence.
- ☐ Authorization of Attorney(s) to Accept and Follow Instructions from Representative
- ☐ Special Comments
- ☐ Other

**5. Declaration or oath**

- ☐ Enclosed
- Executed by

(check all applicable boxes)

- ☐ inventor(s).
- ☐ legal representative of inventor(s). 37 CFR 1.42 or 1.43.
- ☐ joint inventor or person showing a proprietary interest on behalf of inventor who refused to sign or cannot be reached.
- ☐ This is the petition required by 37 CFR 1.47 and the statement required by 37 CFR 1.47 is also attached. See item 13 below for fee.

- ☒ Not Enclosed.

**WARNING:** Where the filing is a completion in the U.S. of an International Application, but where a declaration is not available, or where the completion of the U.S. application contains subject matter in addition to the International Application, the application may be treated as a continuation or continuation-in-part, as the case may be, utilizing ADDED PAGE FOR NEW APPLICATION TRANSMITTAL WHERE BENEFIT OF PRIOR U.S. APPLICATION CLAIMED.

- ☐ Application is made by a person authorized under 37 CFR 1.41(c) on behalf of **all** the above named inventor(s).

[The declaration or oath, along with the surcharge required by 37 CFR 1.16(e) can be filed subsequently.]

NOTE: It is important that all the correct inventor(s) are named for filing under 37 CFR 1.41(c) and 1.53(b).

- ☐ Showing that the filing is authorized.  
[not required unless called in question. 37 CFR 1.41(d)]

## 6. Inventorship Statement

**WARNING:** If the named inventors are each not the inventors of all the claims an explanation, including the ownership of the various claims at the time the last claimed invention was made, should be submitted.

The inventorship for all the claims in this application are:

- ☐ The same.

or

- ☐ Not the same. An explanation, including the ownership of the various claims at the time the last claimed invention was made,  
☐ is submitted.  
☐ will be submitted.

## 7. Language

NOTE: An application including a signed oath or declaration may be filed in a language other than English. A verified English translation of the non-English language application and the processing fee of \$130.00 required by 37 CFR 1.17(k) is required to be filed with the application, or within such time as may be set by the Office. 37 CFR 1.52(d).

NOTE: A non-English oath or declaration in the form provided or approved by the PTO need not be translated. 37 CFR 1.69(b).

- ☒ English  
☐ Non-English  
☐ The attached translation is a verified translation. 37 CFR 1.52(d).

## 8. Assignment

- ☐ An assignment of the invention to Nokia Mobile Phones Limited  
☐ is attached. A separate ☐ "COVER SHEET FOR ASSIGNMENT (DOCUMENT) ACCOMPANYING NEW PATENT APPLICATION" or ☐ FORM PTO 1595 is also attached.  
☒ will follow.

NOTE: "If an assignment is submitted with a new application, send two separate letters—one for the application and one for the assignment." Notice of May 4, 1990 (1114 O.G. 77-78).

**WARNING:** A newly executed "CERTIFICATE UNDER 37 CFR 3.73(b)" must be filed when a continuation-in-part application is filed by an assignee. Notice of April 30, 1993, 1150 O.G. 62-64.

- B. ☐ Design application  
[\$310.00—37 CFR 1.16(f)]

Filing Fee Calculation \$

- C. ☐ Plant application  
[\$480.00—37 CFR 1.16(g)]

Filing Fee Calculation \$

**11. Small Entity Statement(s)**

- ☐ Verified Statement(s) that this is a filing by a small entity under 37 CFR 1.9 and 1.27 is (are) attached.

**WARNING:** \*Status as a small entity in one application or patent does not affect any other application or patent, including applications or patents which are directly or indirectly dependent upon the application or patent in which the status has been established. A nonprovisional application claiming benefit under 35 U.S.C. 119(e), 120, 121 or 365(c) of a prior application may rely on a verified statement filed in the prior application if the nonprovisional application includes a reference to a verified statement in the prior application or includes a copy of the verified statement filed in the prior application if status as a small entity is still proper and desired." 37 C.F.R. § 1.28(a).

(complete the following, if applicable)

- ☐ Status as a small entity was claimed in prior application.  
\_\_\_\_\_/\_\_\_\_\_, was filed on \_\_\_\_\_, from which  
benefit is being claimed for this application under:

35 U.S.C. ☐ 119(e),

☐ 120,

☐ 121,

☐ 365(c),

and which status as a small entity is still proper and desired.

- ☐ A copy of the verified statement in the prior application is included.

Filing Fee Calculation (50% of A, B or C above)

\$\_\_\_\_\_

**NOTE:** Any excess of the full fee paid will be refunded if a verified statement and a refund request are filed within 2 months of the date of timely payment of a full fee. The two-month period is not extendible under § 1.136, 37 CFR 1.28(a).

**12. Request for International-Type Search [37 C.F.R. 1.104(d)]**

(complete, if applicable)

- ☐ Please prepare an international-type search report for this application at the time when national examination on the merits takes place.

## 9. Certified Copy

Certified copy(ies) of application(s)

Country	Appln. no.	Filed
---------	------------	-------

Country	Appln. no.	Filed
---------	------------	-------

Country	Appln. no.	Filed

from which priority is claimed

☐ is (are) attached.

☐ will follow.

NOTE: The foreign application forming the basis for the claim for priority must be referred to in the oath or declaration. 37 CFR 1.55(a) and 1.63.

NOTE: This item is for any foreign priority for which the application being filed directly relates. If any parent U.S. application or International Application from which this application claims benefit under 35 U.S.C. 120 is itself entitled to priority from a prior foreign application, then complete item 18 on the ADDED PAGES FOR NEW APPLICATION TRANSMITTAL WHERE BENEFIT OF PRIOR U.S. APPLICATION(S) CLAIMED.

## 10. Fee Calculation (37 C.F.R. 1.16)

A. ☒ Regular application

CLAIMS AS FILED			
Number Filed	Number Extra	Rate	Basic Fee
			37 C.F.R. 1.16(a)
			\$760.00
Total Claims			
[37 CFR 1.16(c)] 44-20 = 24	24	x \$18.00	432.00
Independent Claims [37 CFR 1.16(b)]			
3-3 = 0	0	x \$78.00	0
Multiple dependent claim(s), if any			
[37 CFR 1.16(d)]	0	+ \$260.00	0

☐ Amendment cancelling extra claims is enclosed.

☐ Amendment deleting multiple-dependencies is enclosed.

☐ Fee for extra claims is not being paid at this time.

NOTE: If the fees for extra claims are not paid on filing they must be paid or the claims cancelled by amendment, prior to the expiration of the time period set for response by the Patent and Trademark Office in any notice of fee deficiency. 37 CFR 1.16(d).

Filing Fee Calculation

\$1192.00

### 13. Fee Payment Being Made at This Time

- ☐ Not Enclosed
- ☐ No filing fee is to be paid at this time.  
(This and the surcharge required by 37 C.F.R. 1.16(e) can be paid subsequently).
- ☒ Enclosed
- |  |           |
|--|-----------|
| <input checked="" type="checkbox"/> Filing fee   | \$1192.00 |
| <input type="checkbox"/> Recording assignment<br>[\$40.00; 37 C.F.R. 1.21(h)]<br>(See attached "COVER SHEET FOR ASSIGNMENT<br>ACCOMPANYING NEW APPLICATION").  | _____     |
| <input type="checkbox"/> Petition fee for filing by other than all the inventors or<br>person on behalf of the inventor where inventor refused<br>to sign or cannot be reached<br>[\$130.00; 37 C.F.R. 1.47 and 1.17(h)] | _____     |
| <input type="checkbox"/> For processing an application with a specification<br>in a non-English language<br>[\$130.00; 37 C.F.R. 1.52(d) and 1.17(k)]  | _____     |
| <input type="checkbox"/> Processing and retention fee<br>[\$130.00; 37 C.F.R. 1.53(d) and 1.21(l)]   | _____     |
| <input type="checkbox"/> Fee for international-type search report<br>[\$40.00; 37 C.F.R. 1.21(e)]  | _____     |

NOTE: 37 CFR 1.21(l) establishes a fee for processing and retaining any application that is abandoned for failing to complete the application pursuant to 37 CFR 1.53(d) and this, as well as the changes to 37 CFR 1.53 and 1.78, indicates that in order to obtain the benefit of a prior U.S. application, either the basic filing fee must be paid, or the processing and retention fee of § 1.21(l) must be paid, within 1 year from notification under § 53(d).

Total fees enclosed \_\_\_\_\_

### 14. Method of Payment of Fees

- ☐ Check in the amount of \$ \_\_\_\_\_
- ☒ Charge Account No. 50-0270 in the amount of \$1192.00

Two duplicates of this transmittal are attached.

NOTE: Fees should be itemized in such a manner that it is clear for which purpose the fees are paid. 37 CFR 1.22(b).

## 15. Authorization to Charge Additional Fees

**WARNING:** If no fees are to be paid on filing, the following items should not be completed

**WARNING:** Accurately count claims, especially multiple dependent claims, to avoid unexpected high charges, if extra claim charges are authorized

- ☒ The Commissioner is hereby authorized to charge the following additional fees by this paper and during the entire pendency of this application to Account No. 50-0270.

☒ 37 C.F.R. 1.16(a), (f) or (g) (filing fees)

☒ 37 C.F.R. 1.16(b), (c) and (d) (presentation of extra claims)

**NOTE:** *Because additional fee for excess or multiple dependent claims not paid on filing or on later presentation must only be paid or these claims cancelled by amendment prior to the expiration of the time period set for response by the PTO in any notice of fee deficiency [37 CFR 1.16(d)], it might be best not to authorize the PTO to charge additional claim fees, except possibly when dealing with amendments after final action.*

☒ 37 C.F.R. 1.16(e) (surcharge for filing the basic filing fee and/or declaration on a date later than the filing date of the application)

☒ 37 C.F.R. 1.17 (application processing fees)

**WARNING:** While 37 CFR 1.17(a), (b), (c) and (d) deal with extensions of time under § 1.136(a), this authorization should be made only with the knowledge that: "Submission of the appropriate extension fee under 37 C.F.R. 1.136(a) is to no avail unless a request or petition for extension is filed " (Emphasis added). Notice of November 5, 1985 (1060 O.G. 27).

☐ 37 C.F.R. 1.18 (issue fee at or before mailing of Notice of Allowance, pursuant to 37 C.F.R. 1.311(b))

**NOTE:** *Where an authorization to charge the issue fee to a deposit account has been filed before the mailing of a Notice of Allowance, the issue fee will be automatically charged to the deposit account at the time of mailing the notice of allowance. 37 CFR 1.311(b).*

**NOTE:** *37 CFR 1.28(b) requires "Notification of any change in loss of entitlement to small entity status must be filed in the application...prior to paying, or at the time of paying,...issue fee " From the wording of 37 CFR 1.28(b): (a) notification of change of status must be made even if the fee is paid as "other than a small entity" and (b) no notification is required if the change is to another small entity.*

*Attorney Work Product – Privileged and Confidential*

# **Mobile Multimedia Terminal for DVB-T**

**And**

## **Large and Small Cell Communication**

### **Field of the Invention**

This invention relates to multimedia terminals and, more particularly, to interactive multimedia terminals using DVB in a mobile environment.

### **Background of the Invention**

The explosion of wireless data communication has been fueled by advances in semiconductor technology and software. These advances have allowed audio and data signals to be transmitted over digital networks.

Digital and mixed signal systems offer many advantages over old-fashioned analog systems. One important advantage is the ability of digital systems to transmit and receive more information at higher rates. Whereas analog systems are limited to transmitting audio and video at a rate of 64 Kbps, digital systems can compress such transmissions to transmit eight times as much information at the same rate. Moreover, faster processors have allowed digital systems to transmit bits at ever increasing rates. By taking advantage of the compression routines and faster processors to transmit information more accurately and at higher rates, significant savings have been realized in both switching capacity and ongoing line costs.

Additional advantages have been realized through the use of multiple access techniques such as Time Division Multiple Access ("TDMA") and Code Division Multiple Access ("CDMA"). These techniques allow for multiple users to access a single bandwidth. They also allow for audio and data signals

transmitted by a single user to be intermingled. These techniques make better use of scarce airwave space.

A recent development in the wireless information revolution has been the transmission of digital video signals over the airwaves, for example, using DVB-T. A similar development is occurring in the RF band, as efforts are being made to add video capability to cellular telephones, fax machines and computers. Before quality video capability can be added to these machines, however, a problem arising from bandwidth limitation must be overcome. Because these machines operate on frequencies between 900 and 1900 Mhz, the bandwidth is not wide enough to transmit the enormous amount of video and audio information that is required for quality motion pictures.

Digital television provides more channels at a higher quality than is currently available with analog broadcasts. One analog channel provides the bandwidth capacity for one high-definition (HDTV) digital broadcast or several standard definition (SDTV) digital broadcasts. Digital television is scalable between these two extremes. Therefore, digital broadcasters can make a trade-off between vastly improved image and sound quality and an increased number of programming choices.

Digital television is deliverable to moving receivers. Currently, analog television reception is non-existent or severally limited in moving receivers. However, digital receivers allow for clear reception in cars, buses, trains, and in handheld television sets such as the Sony Watchman™.

Most of the equipment used to create, edit, and distribute television programs is now digital. The analog reception of a television signal, via cable, aerial, or satellite, is the end result of a long chain of events, most of which have taken place in the digital domain. For example, in delivering a new broadcast, the field reporter uses digital satellite news gathering equipment to

uplink her report to a programming center. The material is digitally received, decoded, and compiled with live program feeds in a studio. The broadcast is then sent digitally around the world to professional receivers. Finally, the broadcast is converted to an analog signal and sent to the end viewer.

5

An intelligent TV can receive communication services by connecting a TV to a value added network (VAN). The intelligent TV includes an information signal processing unit for receiving information communication data (hereinafter, "information data") when the intelligent TV is connected to the VAN, and for generating information RGB signals, and switching control signals in order to display the information data on a screen. The intelligent TV selects and displays on the screen one of the information data signals processed in the information signal processing unit and a TV RGB signal processed in a TV signal processing unit, in accordance with the switching control signal output from the information signal processing unit. Intelligent TV makes it possible to view, through a TV screen, several communication services, such as stock quotes, news services, weather reports, and TV program lists, being transmitted through the VANs. Therefore, it has an advantage that persons who are not familiar with the usage of a computer can easily receive communication services.

20

Even though intelligent TV has the advantage of receiving communication services through the TV screen, it cannot display multiple signals at the same time. Information signals for displaying information data on a screen, a TV signal, a Picture-In-Picture (PIP) signal for enabling two screens to be viewed simultaneously, and a TV on-screen-display (OSD) signal must be displayed one at a time. Therefore, signals are displayed according to a predetermined priority. For example, an information signal is displayed

25

preferentially over a TV signal, a PIP signal is displayed preferentially over an information signal, and a TV OSD signal is displayed preferentially over a PIP signal.

Current information delivery services described above lack many features that would enhance their usability and desirability by the public. As mentioned, the intelligent TV lacks an ability to display multiple signals simultaneously. In addition, an online connection of two delivery services with one of the services being, for example, an interactive application, is not available. Current technologies are dependent on stationary receivers. Since multiple signals cannot be integrated by the integrated receiver/decoder (or IRD), information delivery is dependent on the location or site.

New display technologies provide the possibility to build low power and high quality portable display devices. These devices are based on large full color flat panel displays or on virtual (helmet mount) displays. The common denominator for these kinds of displays is that they are digital and matrix type displays. Introduction of DVB-T enables, for the first time in TV broadcast history, the possibility of truly mobile reception of TV. In addition to conventional TV services, DVB-T provides access to broadcast data services. Integration of DVB-T with digital display unit, such as the flat panel or helmet mount displays described above, makes it possible to build fully digital TV receiver with studio quality picture.

**Figure 3** depicts a block diagram of the current multimedia architecture. Currently, the digital set-top-box (STB) **302** and digital TV display **304** are separate. Furthermore, the STB 302 communication link is only of a single type. For example, the STB communications link is a hard interface such as coax-cable or POTS. Therefore, the typical digital TV 304 connected to an STB 302 offers no portability or mobility.

Laptop and notebook computers are now equipped with the means to connect to networks using a mobile (or wireless) link. Such connections usually utilize a modem and digital wireless transceiver built on a single card, e.g., a PCMCIA card. However, digital TV receivers have not been integrated into such devices. One reason for this lack of versatility is that digital TV receivers have high power consumption rates (relative to other laptop or notebook functions). Thus, the battery power of a laptop would be consumed rapidly. In addition, laptops, like STBs, are typically limited in their ability to communicate externally. For example, a serial port, parallel port and possibly a modem can be used to distribute information from a laptop. However, such devices do not switch between these links seamlessly. Further, such devices do not have the ability to take stock of their environment and dynamically switch to the most appropriate communication link.

### **Summary of the Invention**

The disclosed embodiments provide a method and apparatus for providing an interactive mobile multimedia terminal. The mobile multimedia terminal (or MMT) allows for wideband data stream reception using a digital data broadcast receiver such as DVB-T. Interactivity is realized with built-in local or large cell size communications link. The local link could be WLAN or Bluetooth (a low-power RF transceiver). The large cell size communications link could be a mobile station link e.g., GSM, CDMA, TDMA, etc. A mobile station with a Bluetooth link can be used as an IP router or a portable base station for large cell size communication if no local connection point is found. The MMT integrates DVB-T reception, digital display, and communications links together to provide interactivity in a mobile environment. The MMT communications link with a mobile station enables it to act as an extended

display for the mobile station. The MMT can also act as a graphical interface for SMS messaging via the mobile station or manipulating other applications on the mobile station.

The disclosed embodiments can provide several advantages. For example, the MMT is a single device that can be used in a portable or mobile environment. The MMT is configured with different wireless links, enabling it to adapt seamlessly and dynamically to its communications environment by switching between different communications interfaces, protocols, or links. For another example, the MMT can be used to receive and display (or broadcast) different kind of data. Such data can include, for example, digital content *e.g.*, MP3 files, e-books, or newspapers, e-commerce data, or broadcast TV. For another example, the timing and synchronization manager can be used to save power by controlling the digital receiver of the MMT.

### **Brief Description of the Drawings**

The disclosed inventions will be described with reference to the accompanying drawings, which show important sample embodiments of the invention and which are incorporated in the specification hereof by reference, wherein:

**Figure 1** depicts the presently preferred embodiment of the mobile multimedia terminal;

**Figure 2** depicts the presently preferred embodiment of a MMT and its corresponding communications environment;

**Figure 3** depicts a block diagram of the current multimedia architecture; and

**Figure 4** depicts a block diagram of a mobile station **400** that can act as an IP router or portable base station to the MMT 100.

### **Detailed Description of the Preferred Embodiments**

The numerous innovative teachings of the present application will be described with particular reference to the presently preferred embodiment. However, it should be understood that this class of embodiments provides only a few examples of the many advantageous uses of the innovative teachings herein. In general, statements made in the specification of the present application do not necessarily delimit any of the various claimed inventions. Moreover, some statements may apply to some inventive features but not to others.

**Figure 1** depicts the presently preferred embodiment of the mobile multimedia terminal (or MMT). The MMT provides an interactive, mobile environment. In the presently preferred embodiment, a DVB-T receiver **102** is controlled by a CPU **104**. The DVB-T receiver 102 is capable of receiving digital TV broadcasts according to the DVB-T standard. DVB-S (satellite) and DVB-C (cable) broadcasts are also standardized and may be used. The DVB-T standard specifies a broadband channel, preferably in the VHF frequency range, that carries a digital data stream. In addition to TV broadcasts, channels in the DVB-T spectrum can be used to transmit data intended for receipt by specific users. Such data is generally encrypted for privacy. In this manner, DVB-T (or DVB-S or DVB-C) can be used for data transmission which requires a wideband downstream channel (from the source to the requestor). In the presently preferred embodiment, the MMT **100** is the requestor.

A media decoder **106** is controlled by the CPU **104** and used to decode the received DVB-T broadcast. The DVB-T broadcast standard uses MPEG-2 encoding. Therefore, in the presently preferred embodiment, the media decoder 106 is an MPEG-2 decoder. However, other forms of streaming video can and do use alternate protocols to transmit digital data. The media decoder 106

selected should be designed to match and decode the transmission protocol used by the digital data source.

A display interface **108** receives the decoded broadcast from the media decoder 106. The display interface 108 is designed to optimize the display of data to a user of the MMT 100. For example, the digital data received can be in the form of full motion video or it can be a graphic of some kind. The differing formats require differing modes to be optimally displayed. The display interface 108 acts as a video integrator. For example, the display interface can place a graphics overlay onto full motion video, manipulate the display of full motion video into a certain part of a display, or crop some video or graphics to show only their essential or moving parts on a display. The output of the display interface 108 drives a display **110** for the MMT 100.

In addition to processing a digital broadcast signal, the MMT 100 of the presently preferred embodiment is capable of transmitting information. Such information can include requests for information, data to be downloaded via digital broadcast, phone identification data, or regular voice and data communications over a mobile station (such as a mobile phone). In the presently preferred embodiment, the MMT 100 is equipped with a low-power radio frequency (LPRF) e.g., Bluetooth, transceiver **112**. A transceiver configured according to the Bluetooth standard is capable of short range (approximately 10 meters) radio communication to a local transceiver. The local transceiver can be connected to a LAN, PSTN, or a low or high power wireless network. In addition to a LPRF link, the MMT 100 of the presently preferred embodiment can be configured with a Wireless-LAN **114** or cellular transceiver **116**. The cellular transceiver can be, for example, a GSM, TDMA, CDMA, AMPS, or other standard or proprietary communications protocol. The CPU controller 104 of the MMT 100 is configured to select the mode of

communication between transceivers 112, 114, and 116 dynamically. The CPU 104 can select the appropriate communications link according to the current communications environment. For example, if a Bluetooth transceiver is detected, data can be exchanged using the Bluetooth transceiver 112 without the need for acquiring a channel on a cellular link. However, if voice data is to be transmitted, a cellular link would be desirable. Thus the CPU 104 would select the cellular transceiver 106 for transmission duties.

The LPRF link 112 of the MMT 100 can be used in conjunction with an external mobile station. The external mobile station can act as a portable (close range) base station. The external mobile station can also act as an IP router for web browsing and other network activities.

The DVB-T receiver 102 of the MMT 100 is activated or deactivated by the CPU 104. The DVB-T receiver 102 can be activated at user request. That is, when the user wishes to receive broadcast data or is expecting to receive broadcast data. The CPU 104 can also monitor the environment for service information and activate the DVB-T receiver 102 if conditions warrant it. For example, if services the user wishes to receive are detected, the CPU 104 can activate the DVB-T receiver 102. As another example, the CPU 104 can activate the DVB-T receiver 102 if and when it needs to, in order to impart important or timely data to the user, e.g., weather or news data.

In the presently preferred embodiment, the DVB-T receiver 102 is equipped with a timing element 118 enabling it to remain synchronous with the digital broadcast facility. This timer 118 makes it possible to switch on the receiver and pick up the selected data packets days after the last system synchronization. The timer 118 allows the CPU 104 to control activation of the DVB-T receiver 102 also enables power savings. For example, if video functionality is not currently in use, that is, digital broadcasts are not being or

do not need to be received, the DVB-T receiver 102 is switched off by the CPU 104. Such a situation can occur when, for example, the MMT is web browsing over a communications link 112, 114, or 116.

**Figure 2** depicts the presently preferred embodiment of a MMT 100 and its corresponding communications environment **200**. Media is provided by a service provider **202**. Media can include, for example, data services, decryption keys for smart cards, digital TV, digital audio, or other digital data. The media can be provided on the request by user or under a “broadcast” principle. In the presently preferred embodiment specific requests for data are handled via a mobile station **204** equipped with an LPRF transceiver. The requests are transmitted via an LPRF link from the MMT 100 to the mobile station 204. The mobile station 204 relays the request via a wireless operator **206**. The service provider 202 capable of providing the requested data receives the request from the wireless operator 206. The media content is routed from the service provider 202, via DVB-scrambling **210**, to a DVB Network operator **212**. The DVB Network operator 212 multiplexes the media content with free to air TV Services **214** and transports the data over a DVB broadcast channel **208**.

At the MMT 100, the DVB-T transmission is received by the DVB-T receiver 102. A front end receiver **216** in the DVB-T receiver 102 receives the transmission, acting as the over-the-air interface of the receiver 102. Data is transmitted to a descrambler **218** with a smart card **220**. The descrambler 218 is optional in the presently preferred embodiment. The decrypted/descrambled data is then forwarded to a demultiplexer **222**.

The front end 216, descrambler 218, smart card 220, and demultiplexer 222 consume a majority of the power used by the DVB receiver 102. Data for

the demultiplexer 222 is routed to the media decoder 106. Alternatively, the data can be routed to buffer or storage memory 224 or an optional memory card 226. Storing the data instead of decoding and displaying it is dependent on the set up and usage of the DVB-T receiver 102. For example, by storing data into memory, it is possible to display one data stream while receiving another. In the presently preferred embodiment, the timing and synchronization manager 118 controls the front end 216, descrambler 218, smart card 220, and demultiplexer 222. The timing and synchronization manager 118 activates these receiver components only when needed or upon user request. The CPU 104 of the MMT 100 controls all of the components of the MMT. The CPU 104 is responsible for reading the service information and determining the communication environment of the MMT 100. The CPU 104 is used to configure the timing and synchronization manager 118.

Content to be shown on the display 110 of the MMT 100 can originate either from CPU 104 via memory 224 or 226 or from media decoder 106. The display of the MMT 100 can be, for example, a flat panel TFT display or a virtual display such as a head mounted LCOS 3D display. Display data is processed by the display interface 108 of the MMT. This interface 108 performs the needed operations of scaling, zooming, frame rate conversions, filtering, in order to appropriately display the data on the display 110 of the MMT 100. The display interface 108 can be configured to optimally display data depending on its type and the type of display 110 to be utilized.

Digital content can also include audio signals. Such content can be presented through the audio output 230 of the MMT 100. The audio output 230 of the MMT can be, *e.g.*, speakers.

The MMT 100 can be configured to communicate in a variety of ways. For example, an LPRF link 112 can be used to communicate with a mobile

station acting as a portable base station or IP router. For another example, in a home gateway environment, the MMT 100 can act as a node in a Wireless LAN using a WLAN transceiver 114.

**Figure 4** depicts a block diagram of a mobile station **400** that can act as an IP router or portable base station to the MMT 100. The mobile station 400 includes, in this example:

A control head **402** containing an audio interface, i.e. a speaker **404** and microphone **406**. The control head 402 generally includes a display assembly **408** allowing a user to see dialed digits, stored information, messages, calling status information, including signal strength, etc. The control head generally includes a keypad **410**, or other user control device, allowing a user to dial numbers, answer incoming calls, enter stored information, and perform other mobile station functions. The control head also has a controller unit **434** that interfaces with a logic control assembly **418** responsible, from the control unit perspective, for receiving commands from the keypad 410 or other control devices, and providing status information, alerts, and other information to the display assembly 408;

A transceiver unit **412** containing a transmitter unit **414**, a receiver unit **416**, and the logic control assembly 418. The transmitter unit 414 converts low-level audio signals from the microphone 406 to digital coding using a codec (a data coder/decoder) **420**. The digitally encoded audio is represented by modulated shifts, for example, in the frequency domain, using a shift key modulator/demodulator **422**. Other codes transmission utilized by the logic control assembly 418, such as station parameters and control information, may also be encoded for transmission. The modulated signal is then amplified **424** and transmitted via an antenna assembly **426**;

The antenna assembly 426 contains a TR (transmitter/receiver) switch 436 to prevent simultaneous reception and transmission of a signal by the mobile station 400. The transceiver unit 412 is connected to the antenna assembly 426 through the TR switch 436. The antenna assembly contains at least one antenna 438;

The receiver unit 416 receives a transmitted signal via the antenna assembly 426. The signal is amplified 424 and demodulated 422. If the signal is an audio signal, it is decoded using the codec 420. The audio signal is then reproduced by the speaker 404. Other signals are handled by the logic control assembly 418 after demodulation 422; and

A logic control assembly 418 usually containing an application specific integrated circuit (or ASIC) combining many functions, such as a general purpose microprocessor, digital signal processor, and other functions, into one integrated circuit. The logic control assembly 418 coordinates the overall operation of the transmitter and receiver using control messages. The various disclosed embodiments make use of the logic control assembly to control scanning and evaluation of other base stations. Generally, the logic control assembly operates from a program that is stored in flash memory 428 of the mobile station. Flash memory 428 allows upgrading of operating software, software correction or addition of new features. Flash memory 428 is also used to hold user information such as speed dialing names and stored numbers.

In addition to flash memory 428, the mobile station will typically contain read only memory (ROM) 430 for storing information that should not change, such as startup procedures, and random access memory (RAM) 432 to hold temporary information such as channel number and system identifier.

In the presently preferred embodiment, the mobile station also includes an LPRF transceiver 112, *e.g.*, Bluetooth, for communication with the MMT 100.

## 5      **Modifications and Variations**

As will be recognized by those skilled in the art, the innovative concepts described in the present application can be modified and varied over a tremendous range of applications, and accordingly the scope of patented subject matter is not limited by any of the specific exemplary teachings given.

10      For example, the digital receiver is described as a DVB-T receiver. However, the digital data received could be in any of a variety of digital formats, frequencies, protocols, etc. The digital receiver used should be configured to receive the types of data expected. Moreover, the digital receiver could be configured to receive digital information in a variety of formats or  
15      receive analog *e.g.*, NTSC or PAL, and digital broadcasts.

For another example, the presently preferred embodiment is described as having only one digital receiver. However, differing embodiments of the MMT may be configured with multiple digital receivers. The use of more than one digital receiver can serve to increase the robustness of the data received in  
20      digital broadcast.

For another example, the presently preferred embodiment is described as operating over differing communications links, one at a time. However, it is possible that several of the communications links, *e.g.*, LPRF, WLAN, and/or a wireless mobile station link can be operated at once to send and receive  
25      information to multiple places simultaneously.

For another example, while not stated explicitly in the presently preferred embodiment, it is possible to integrate a mobile station into the MMT. An

integrated MMT/mobile station would allow the MMT to function as its own IP router or portable base station.

For another example, digital broadcast of data is anticipated in the presently preferred embodiment. However, it is possible that third generation (3G) or greater cellular networks will have the capacity to deliver TV reception and broadband data transmission. The MMT can be equipped with a different or alternate receiver which is configured to receive such digital data.

Exhibit A-1

## Claims

What is claimed is:

- 1 1. A method of mobile multimedia terminal interactivity, comprising the steps  
2 of:  
3 requesting information from a digital service provider;  
4 receiving a data signal from said digital service provider over the air;  
5 decoding said data signal for presentation;  
6 optimizing said data signal for output; and  
7 presenting said optimized signal as output.
- 1 2. The method of Claim 1, wherein said requesting step uses one of a plurality  
2 of wireless communications links.
- 1 3. The method of Claim 1, wherein said requesting step uses one of a plurality  
2 of wireless communications links and a controller determines the  
3 appropriate communications link.
- 1 4. The method of Claim 1, further comprising the step of storing said data  
2 signal.
- 1 5. The method of Claim 1, wherein said optimizing step further comprises the  
2 step of manipulating the data signal for display.

6. The method of Claim 1, wherein said optimizing step further comprises the step of combining said data signal with other data to create a display.

7. The method of Claim 1, wherein said data signal is received from a digital broadcast channel.

8. The method of Claim 1, wherein said data signal is display data for a mobile station.

9. The method of Claim 1, wherein said data signal is in DVB-T format.

10. The method of Claim 1, wherein said data signal is in MP3 format.

11. The method of Claim 1, wherein said presenting step uses a video display.

12. The method of Claim 1, wherein said presenting step uses an audio output.

1 13. A mobile multimedia terminal, comprising:  
2 At least one receiver connected to receive over the air data signals;  
3 a controller connected to said receiver to manage and coordinate the  
4 functions of said receiver;  
5 a display interface connected to said media decoder to optimize said  
6 received over the air data signals for display; and  
7 a low power radio frequency transceiver connected to said controller to  
8 provide an interactive environment with respect to said  
9 received over the air data signals.

10 14. The mobile multimedia terminal of Claim 13, further comprising a media  
11 decoder connected to said receiver and said controller to decode  
12 said received over the air data signals.

13 15. The mobile multimedia terminal of Claim 13, wherein said controller  
14 switches the operation of said receiver on and off according to the  
15 communications environment.

16 16. The mobile multimedia terminal of Claim 13, further comprising a timing  
17 and synchronization connected to said controller and said receiver.

18 17. The mobile multimedia terminal of Claim 13, further comprising a timing  
19 and synchronization connected to said controller and said receiver  
20 wherein said timing and synchronization manager enables  
21 reception of said over the air data signals without resynchronizing  
22 said receiver.

1 18.The mobile multimedia terminal of Claim 13, further comprising a display  
2 connected to said display interface to display video data.

1 19.The mobile multimedia terminal of Claim 13, further comprising an audio  
2 output to present audio data.

1 20.The mobile multimedia terminal of Claim 13, further comprising memory  
2 connected to said controller to store said received over the air data  
3 signals.

1 21.The mobile multimedia terminal of Claim 13, wherein said over the air data  
2 signal is display data for a mobile station.

1 22.The mobile multimedia terminal of Claim 13, further comprising a wireless  
2 local area network transceiver connected to said controller to  
3 provide interactivity with said received over the air data signals.

1 23.The mobile multimedia terminal of Claim 13, further comprising a mobile  
2 station transceiver connected to said controller to provide  
3 interactivity with said received over the air data signals.

1 24.The mobile multimedia terminal of Claim 13, further comprising a mobile  
2 station transceiver connected to said controller to provide  
3 interactivity with said received over the air data signals.

25. The mobile multimedia terminal of Claim 13, further comprising a mobile station transceiver and a wireless local area network transceiver connected to said controller wherein said controller selects one of said transceivers to provide interactivity with said received over the air data signals according to the communications environment.

26. The mobile multimedia terminal of Claim 13, wherein at least one of said receivers is a DVB-T receiver.

1 27. An interactive mobile multimedia terminal system, comprising:  
2 a mobile station which communicates data requests;  
3 a service provider which receives said data requests and provides data  
4 according to said requests;  
5 a broadcast operator which receives said data from said service provider  
6 and transmits said data over a broadcast channel; and  
7 a mobile multimedia terminal which includes,  
8 at least one receiver which receives said data;  
9 a media decoder connected to said receiver to decode said received  
10 data;  
11 a controller connected to said receiver and said media decoder to  
12 manage and coordinated the functions of said receiver  
13 and said media decoder;  
14 a display interface connected to said media decoder to optimize  
15 said received data for display; and  
16 a low power radio frequency transceiver connected to said  
17 controller to provide interactivity with said received  
18 data and a communications link to said mobile station.

1 28. The interactive mobile multimedia terminal system of Claim 27, wherein  
2 said controller switches the operation of said receiver on and off  
3 according to the communications environment.

1 29. The interactive mobile multimedia terminal system of Claim 27, further  
2 comprising a timing and synchronization connected to said  
3 controller and said receiver.

1 30.The interactive mobile multimedia terminal system of Claim 27, further  
2 comprising a timing and synchronization connected to said  
3 controller and said receiver wherein said timing and  
4 synchronization manager enables reception of said over the air  
5 data signals without resynchronizing said receiver.

1 31.The interactive mobile multimedia terminal system of Claim 27, further  
2 comprising a mobile station transceiver and a wireless local area  
3 network transceiver connected to said controller wherein said  
4 controller selects one of said transceivers to provide interactivity  
5 with said received over the air data signals according to the  
6 communications environment.

1 32.The interactive mobile multimedia terminal system of Claim 27, wherein at  
2 least one of said receivers is a DVB-T receiver.

1 33.The interactive mobile multimedia terminal system of Claim 27, wherein  
2 said over the air data signal is display data for said mobile station.

1 34.The interactive mobile multimedia terminal system of Claim 27, further  
2 comprising a media decoder connected to said receiver and said  
3 controller to decode said received over the air data signals.

1 35.The interactive mobile multimedia terminal system of Claim 27, further  
2 comprising a display connected to said display interface to display  
3 video data;.

1 36.The interactive mobile multimedia terminal system of Claim 27, further a  
2 media decoder connected to said receiver and said controller to  
3 decode said received over the air data signals.

1 37.The interactive mobile multimedia terminal system of Claim 27, further  
2 comprising audio output to present audio data.

1 38.The interactive mobile multimedia terminal system of Claim 27, further  
2 comprising memory connected to said controller to store said  
3 received over the air data signals.

1 39.The interactive mobile multimedia terminal system of Claim 27, further  
2 comprising a wireless local area network transceiver connected to  
3 said controller to provide interactivity with said received over the  
4 air data signals.

1 40.The interactive mobile multimedia terminal system of Claim 27, further  
2 comprising a mobile station transceiver connected to said  
3 controller to provide interactivity with said received over the air  
4 data signals.

1 41.The interactive mobile multimedia terminal system of Claim 27, wherein  
2 said mobile station includes a low-power radio frequency  
3 transceiver for receiving data from said mobile multimedia  
4 terminal.

1 42.The interactive mobile multimedia terminal system of Claim 27, wherein  
2 said mobile multimedia terminal transmits data requests to said  
3 mobile station.

1 43.The interactive mobile multimedia terminal system of Claim 27, wherein  
2 said mobile multimedia terminal transmits data requests to said  
3 mobile station using said low-power radio frequency transceiver.

1 44.The interactive mobile multimedia terminal system of Claim 27, wherein  
2 said mobile station is integrated into said mobile multimedia  
3 terminal.

## **ABSTRACT**

A method and apparatus for providing an interactive mobile multimedia terminal. The mobile multimedia terminal (or MMT) allows for wideband data stream reception using a digital data broadcast receiver such as DVB-T. Interactivity is realized with built-in local or large cell size communications link. The local link could be WLAN or Bluetooth (a low-power RF transceiver). The large cell size communications link could be a mobile station link e.g., GSM, CDMA, TDMA, etc. A mobile station with a Bluetooth link can be used as an IP router or a portable base station for large cell size communication if no local connection point is found. The MMT integrates DVB-T reception, digital display, and communications links together to provide interactivity in a mobile environment. The MMT communications link with a mobile station enables it to act as an extended display for the mobile station. The MMT can also act as a graphical interface for SMS messaging via the mobile station or manipulating other applications on the mobile station.
